

ABSTRACT

A method and system for preventing unauthorized copying of a film using a recording device is disclosed. The film is played using a projector residing on a first side of the screen. At least one image from the film is thus displayed on a screen. The method and system include providing at least one signal to the screen from a second side of the screen. The second side of the screen is opposite to the first side. The signal(s) are preferably invisible to the human eye but visible to a recording device used in copying the film. The signal(s) are also sufficient to wash out at least a portion of the image to the recording device.
